ABSTRACT

A system for the remote monitoring or modification, whether temporary or permanent, of a running application's attributes. These attributes include, for example, art, sound, music, text, environmental variables or artificial intelligence parameters, program source code, program pseudo code, program compiled code or any other computerized attributes. The application is enabled so that there is the ability to dynamically monitor an application's internal data, components and functionality via a remote station and/or dynamically save application usage data while that application is executing. Further, this program has the ability to temporarily or permanently change internal settings and attributes of the application and add extra functionality to the application. If changes or added functionality are permanent, they can be used when the application is executed.
